1 Project Overview

WanderWise is a website designed as a simple travel guide to help visitors plan short trips. The website brings together destination discovery, travel-planning advice, visual media, and a direct contact option in one place. Its aim is to provide a straightforward user experience in which travelers can explore destinations, compare options, read practical tips, view travel-related media, and contact the project team.

The website is organized into six main pages: Home, Destinations, Travel Tips, Gallery, Contact Us, and Team Members. The interface uses a shared navigation bar to help visitors move between these sections.

2 Project Team and Responsibilities

The source report lists the following team members and responsibilities. One member is named in the original report without a specific responsibility being stated, so no role has been inferred for that person.

Team Member	**Responsibility**
Faisal Alshehri	Developed the front-end HTML structure and organized the website pages.
Abdulmohsen Almutairi	Developed JavaScript interactions, including the name-shuffling feature and date updates.
Abdullah Alqahtani	Worked on user-experience design and the CSS styles, including layout, colors, and visual elements.
Fares Alqahtani	Reviewed code quality, checked the data model, and prepared the final documentation and reference files.
Bander alruwili	Listed as a project team member; a specific role was not stated in the source report.

3 Website Pages and Features

3.1 Home Page (`index.html`)

The Home page introduces WanderWise and gives visitors an overview of the website's purpose. It includes the main navigation bar, a welcome message, and links that guide visitors toward exploring destinations or asking a question. The page is intended to make the website's purpose clear as soon as a visitor arrives.

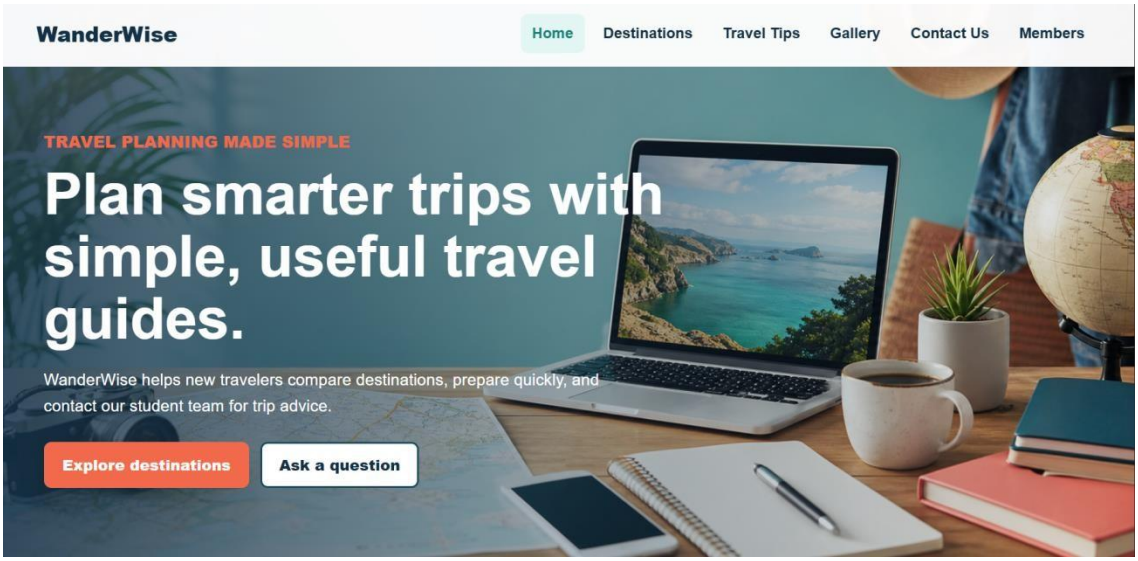

Figure 1: Home page: welcome section and main navigation.

3.2 Destinations Page (`destinations.html`)

The Destinations page presents suggested trip ideas using visual destination cards. The cards provide short descriptions and actions for visitors who want to learn more. The page also includes a structured comparison of key features for each destination, helping visitors compare options according to their preferences and travel plans.

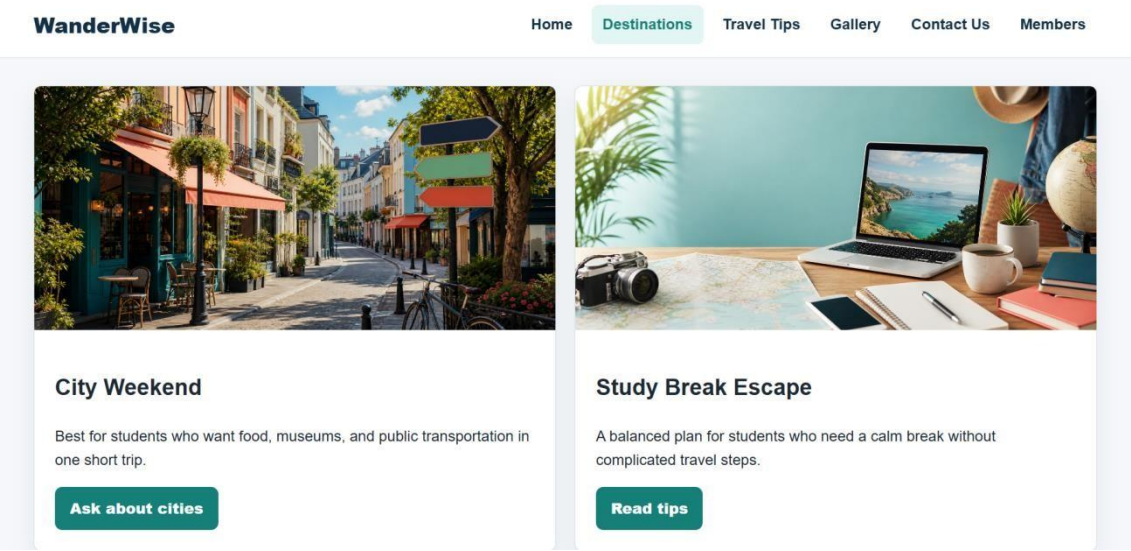

Figure 3: Destinations page: destination cards and trip suggestions.

3.3 Travel Tips Page (`tips.html`)

The Travel Tips page provides concise guidance to help users prepare for a trip. Its content is organized into readable lists and practical reminders. The screenshot shows sections for a packing list, budget planning, and safety notes. These sections help travelers remember important items, plan spending, and consider basic safety practices before leaving.

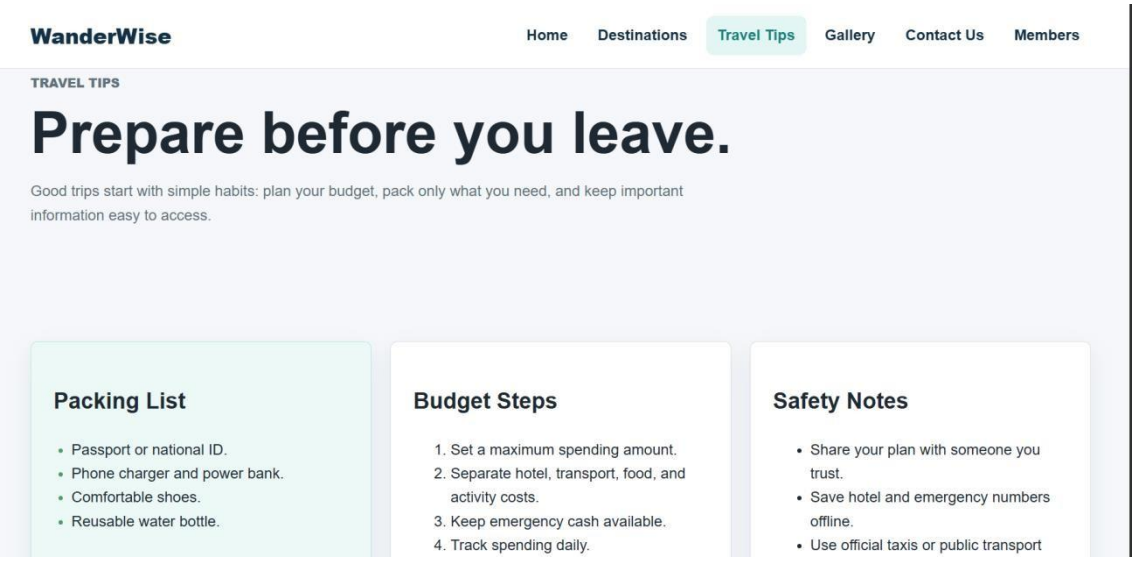

Figure 4: Travel Tips page: packing, budgeting, and safety guidance.

3.4 Gallery Page (`gallery.html`)

The Gallery page displays travel-related visual content. It includes illustrative travel imagery and an interactive video player that uses an external link as the video source. The purpose of this page is to provide visual inspiration and a media-based element alongside the site's written travel guidance.

3.5 Contact Us Page (`contact.html`)

The Contact Us page provides a form through which visitors can send an inquiry to the project team. The form includes fields such as full name, email address, phone number, preferred travel date, topic, and message. According to the source report, the form checks the validity of entered data and displays alert messages to guide users when submitting it. A contact-details panel is also shown beside the form.

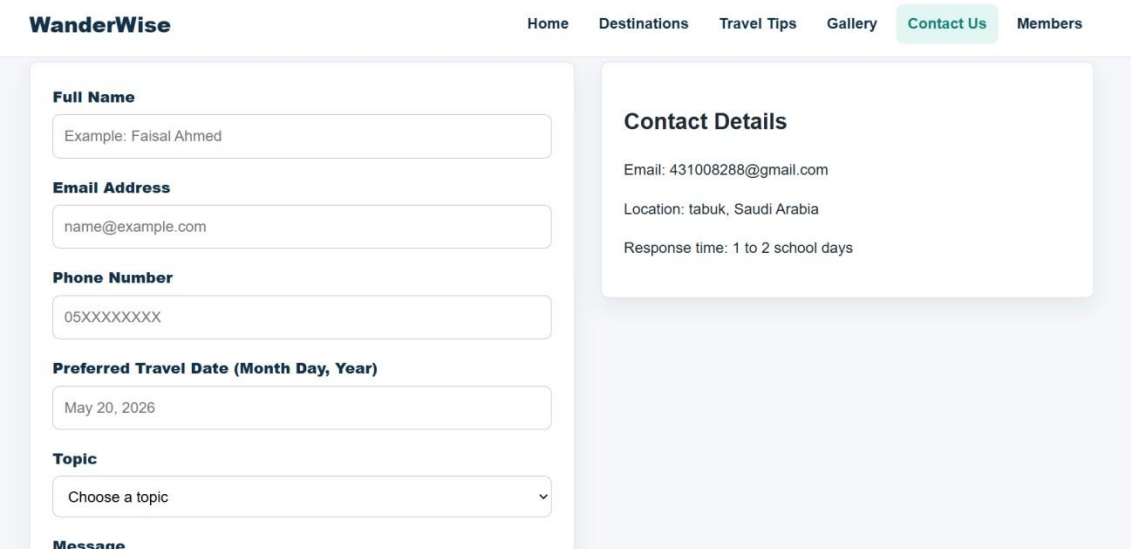

Figure 6: Contact Us page: inquiry form and contact information panel.

3.6 Team Members Page (`members.html`)

The Team Members page displays the project team in a dynamic list. A button allows the names to be rearranged randomly. This interaction is connected to JavaScript and demonstrates a simple example of client-side page behavior. The page also summarizes

the website's focus, including sharing useful destination information, making travel tips easy to understand, organizing visitor contact requests, and keeping the website simple.

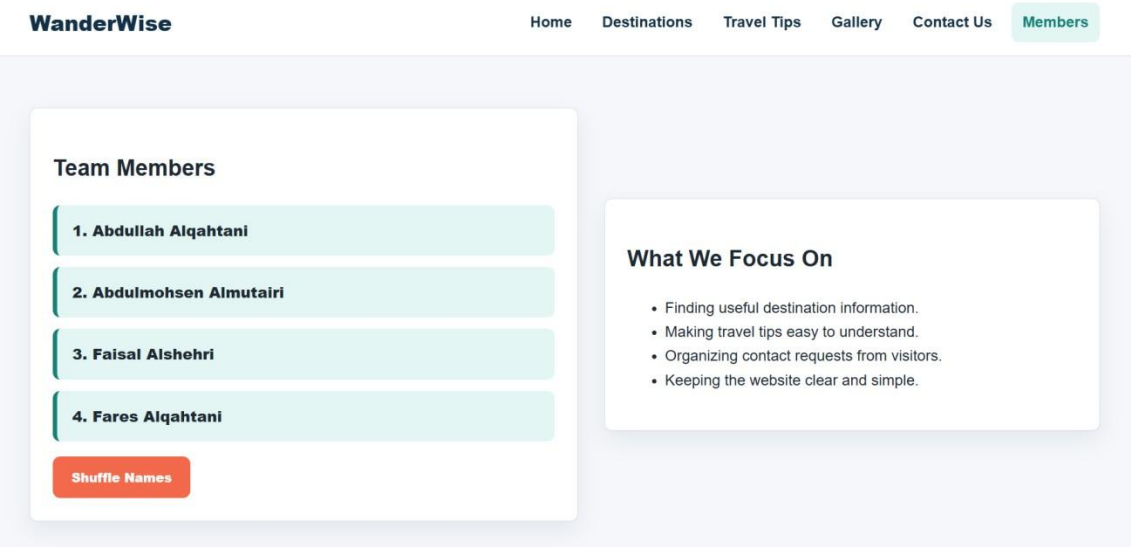

Figure 7: Team Members page: team list and the "Shuffle Names" interaction.

4 Technologies and Implementation

The project report identifies the following web technologies and implementation areas:

- **HTML:** Provides the structure of the website pages and their content.
- **CSS:** Defines the visual presentation, including layout, colors, spacing, and interface elements.
- **JavaScript:** Supports interactive behavior, including randomly rearranging team names and updating dates. The Contact Us page also provides form-validation feedback, as described in the source report.
- **External media:** The Gallery page uses an external video link as the source for its video player.

The available project report does not specify a back-end framework, database, hosting provider, automated testing framework, or deployment process. These technologies are therefore not claimed as part of this report.

5 User Experience and Design

WanderWise groups related information into separate pages and uses consistent navigation to support movement around the site. Destination cards and visual media make the content easier to browse, while the Travel Tips page uses short lists to keep guidance readable. The contact form offers a direct communication path, and its validation messages are intended to help visitors correct incomplete or invalid entries. The Team Members page adds a small interactive feature through the name-shuffling button.

6 Conclusion

WanderWise is a compact travel-guide website for people planning short trips. It combines destination suggestions, practical travel advice, visual media, a contact form, and a team page in a single website. The project demonstrates the use of HTML for page structure, CSS for presentation, and JavaScript for interactive features. Its overall goal is to make travel information simple to explore and to provide visitors with a convenient way to contact the team.
